This guide uses the most popular version of Photoshop, called Photoshop CS4, but will be applicable to earlier versions (CS3, CS3, CS2, CS2) as well. If you're looking for the next version, check out our CS6 guide. Photoshop CS4: Navigator is the world of creativity to us. So much new stuff! Photoshop's latest release, Photoshop CS4, offers a plethora of new and exciting features for the program. Like any software product, it doesn't all live on the surface; it's always improving and is one of the most used photo editing software programs in the business. So, let's take a look at some of the exciting features coming to Photoshop CS4.

1. Quick Fix UI One of the most sought-after additions to Photoshop is the Quick Fix tool, also called "Fix," "Fixup," or "Fast." The user interface (UI) has been improved and is now a lot simpler. Quick Fix The Quick Fix tool, simply introduced with Photoshop CS2, allows you to perform a range of tasks to correct common problems with your image. How fast you can fix problems can really improve the effectiveness of Photoshop. Once a problem has been found, the user is allowed to crop out and edit any unwanted content using the Quick Selection tool, crop out and repair any problems with the Background Eraser tool, or even improve the overall quality of your image using the Red-Eye Removal tool or the Adjust Color tool. In essence, the Quick Fix tool is one of the fastest and most effective editing tools available in a raster image editing software program.
2. True Color Control Photoshop is starting to catch on to the importance of true color reproduction. Previously, color management was managed in an internal system and was handled by the developers of the software. The next version of Photoshop, Photoshop CS4, will have true color control under the menu Fix > Edit Color, where you'll be able to, for the first time, control the RGB (Red, Green, and Blue) values of images. In addition to having the option to control each of the three colors, a new Protect option will be available under the same menu, giving you the opportunity to restrict an image from changing, and keep it in the same original state.
3. Color Match One of the most commonly used editing tools in Photoshop is the Color Match

It's official: After many rumors and speculations, Tesla has officially launched the Model Y. A collaboration with its big German rival, it will sit in the middle between the Model 3 and the Model S/X, measuring around six feet long. A large pickup version is in the offing as well. Model Y: Competitor to Tesla's Model 3 Tesla CEO Elon Musk sat down with CNBC's Becky Quick on Tuesday to talk about the big new vehicle and why he decided to go ahead with it. He said that it was a combination of price and capacity. "This is the cheapest, smallest, most efficient Roadster-like sports car," Musk said. "And it has crazy range of over 400 miles per charge, two and a half times the range of the Model 3." While it won't beat the range of the Model 3, Musk said the timing made it a priority. "This is an electric car that's going to go to the moon and Mars," Musk said. "And what matters is not whether it can beat the Model 3 on paper or not, but whether it can beat it in the real-world, down the road." The new car comes with two drive units, one for high-speed road trips and the other for "everyday driving." A German large pickup is also part of the plans. Musk showed off a prototype of the truck in China in 2016, but the company never announced its plans to launch the vehicle. The truck is currently on the schedule for sometime in 2019. Filling the gap With the new car, Musk is filling a gap in the Tesla lineup between the high-priced Model S, and the low-priced Model 3. By lowering prices, Tesla is able to make the Model 3 much more affordable. "People are willing to pay a lot less for a car than they are for a house. So this is a car that can replace a \$100,000 Model 3 with a \$40,000 Model Y," Musk said. Until now, Tesla had only sold expensive versions of its cars. While the Model S costs about \$75,000 and the Model X costs at least \$100,000, the new Model Y will come in at a price point of about \$50,000. Space for the family Musk said that the decision to launch the Model Y after the Model 3 was made because the

Q: Implementing column-based filtering in a table view for re-displaying data I have implemented a tableview that displays (via an NSArrayController) a list of objects. The tableview is working fine as far as the data is concerned and I also have working column-based filtering (A must for me). I have a problem, however, when re-displaying the content of the tableview when a filter row is tapped. The cellForRowAtIndexPath method is called, but the actual table view data is not yet set up, so I get the default tableview cells. The main problem is that this time the table doesn't use the column based filtering that is already implemented. How can I implement "continued filtering" (for lack of a better word) to the tableview? A: The NSArrayController delegate's tableView:objectValueForTableColumn:row: method has a number of instance variables available to it which could be accessed by the NSFetchedResultsController. For example, you can index the NSFetchedResultsController at its sectionIndexTitles array and use its sectionIndexTitlesArray to tell the table view how many sections there are in the NSFetchedResultsController's container table. Alternatively, you can create an NSFetchedResultsController with a secondary index for the column in question, and request the results for that secondary index, either by calling managedObjectContext:performBlock:withObject:insertedInto:sortDescriptors:mergeChanges: on the NSFetchedResultsController instance or by having the NSArrayController set the index of its predicate to a term in the column index. Q: Upper bound on binomial coefficients In the proof of Dirichlet's theorem on arithmetic progressions, the following lemma is used Let $(\alpha_1, \dots, \alpha_n)$ be a sequence of positive real numbers. Then $\frac{1}{n!} \sum_{k_1=1}^n \dots \sum_{k_n=1}^n$

$\frac{1}{\alpha_1^{k_1} \dots \alpha_n^{k_n}} \leq 1$ Proof: first, we may assume $n=2$ by induction: $\begin{split} 1) & \& \backslash$
