The Photoshop website (www.adobe.com/photoshop) is usually up to date with the latest Photoshop versions. If your version isn't listed there, you'll find it on your computer's CD or DVD. Photoshop Elements When I talk about Photoshop, I usually include the word "Elements," which is the name of Adobe's offering that's designed to provide most of what Photoshop has to offer and can be downloaded for free from the Adobe website (www.adobe.com/elements). In the past, Photoshop was the more complex of the two programs, with Elements being simpler, smaller, and good for beginners. But with the new "Lightroom" built into Photoshop CS5, Elements has been stripped down to make it even more simple, more powerful, and more geared toward beginners. Photoshop CS5 is the most powerful version of Photoshop yet. It includes a new, open, flat editing interface that makes working with multiple layers much easier. Elements includes a similar interface and so most people use Elements to create images from scratch and then import them into Photoshop for further manipulation. (The good news for Elements users: They don't need to buy Photoshop to use Photoshop Elements, either.) Photoshop CS5 is an upgrade over CS4 and has many of the changes that we discuss in the following sections. Building a new document When you open Elements, you work in a document that has a photo-based interface. Like a traditional photo album, the image can be edited and saved as a new file, and you can work with other images in the same document. Elements includes a program that combines multiple images into a single photo-gallery page, making the product a good substitute for web photo albums. After you import images into Elements, you place them into ".psd" (the Photoshop document format) files. Figure 8-3 shows a window where you can quickly add an image to a ".psd" document. **Figure 8-3** The image selection tool lets you select and copy an image to work with in Photoshop. Choosing an image You can directly download a ".psd" file for a given photo onto your computer from the Internet, or you can save a ".jpg" file of an image from a digital camera directly to your computer. You can then add that image to your Elements document and work with it later when you open the document. Here

More useful reviews: You can use Photoshop Elements to edit images, create high quality images, or both. If you're an amateur photographer, you'll find Photoshop Elements a great, affordable alternative to Photoshop. Even if you're a professional photographer, you'll still find Photoshop Elements useful for low-key editing tasks such as cropping, resizing, rotating and colour adjustments. If you're not really a photographer, but would like to learn the basics of photography, you can buy an inexpensive pocket camera to get started. If you want a more advanced photo editing tool, you can still get the professional version of Photoshop Elements. The purpose of this guide is to help you use Photoshop Elements to edit images and create new high-quality images. Q: Bash - verify a double ended pipe I have a pipe that connects 2 processes. The process on the end of the pipe does not write to it and I want to verify that with bash. This is what I currently have: `#!/bin/bash function do-execution { echo >${PRO_PIPE[1]} sleep 10 echo $* } # Double Pipe if [-z $PRO_PIPE[1]] then echo "ERROR: PIPE IS NONE..." exit fi if [-c $PRO_PIPE[1]] then do-execution $PRO_PIPE[1] $PRO_PIPE[2] do-execution $PRO_PIPE[2] $PRO_PIPE[1] unset PRO_PIPE fi` However, running this, I am getting a type mismatch error that is complaining about the pipe not being double ended. What am I missing here? A: The reason why you get the error is that the variables `PRO_PIPE[2]` and `PRO_PIPE[1]` do not exist, so you are trying to assign the string `"PRO_PIPE"` to them. You don't have to test the end of the pipe for existence. The contents of the pipe are automatically closed, you just have to close the ends yourself. In the example below, the endpoints of the pipe are both connected to a buffer variable: `buf=""; (echo foo; echo bar; echo foo) | \tee -a "$buf" | \bash "$buf" foo bar` If you don't want a buffer and don't want the output redirected, the technique below works (note that the error is due to lack of quotes around `SPRO_PIPE`)

Q: How to put the result of a query into a list this is my code that I currently have. I want to make the statement into a list so that I can print it out later on, like, `for item in result[0]: print item['track']` I know that I need to add something to the list but I don't know what `list = []` for `item in result[0]: list.append(item)` print list can anyone help me please? A: Use this `for item in result[0]: print item['track']` or this: `list = result[0]` Here, `result[0]` is only one list, so you may loop through it. Q: Suggestions for using UML to diagram an application I am wondering if anyone has experience in using UML to design an application. I am starting to design a system that will be used for a web based reservation system. I have never used UML before and am hoping for some input. A: While UML is mostly a specification of object models, you can use it for most other things as well. You do not need to be an object modeler to use UML to reason about your system. UML makes it possible to visualize the structure and behavior of your system, but do not require it to make it. When you design an application, you have to consider the users and tasks as well. You should probably start by identifying actors (users and tasks), as well as the resources needed to run your application. Then, you should design your user interaction to fit your application. For example, a web interface is designed for the interaction of users, so you should design your web interface so it fits the users. The user interface can also be a web page design, a mobile application design, etc. You do not have to show every possible user interface, just the minimum to accomplish the user tasks. You could for example make a feature (either an admin or personal feature) that only a user is allowed to see, depending on whether the user is authorized to see it. Let's say you have a feature to view a feature description. A user could view a feature description by logging in to
