A screen capture showing the ease of using AutoCAD, from an instructional video published by Autodesk: In 2018, the U.S. Bureau of Labor Statistics estimated that there were about 106,870 AutoCAD designers, and 135,720 AutoCAD users in the U.S. economy. History Development and early years The AutoCAD graphics system and software was initially developed in 1975 and 1976 by the Autodesk and Inventix teams. The Inventix team was co-led by Wolfgang Metzger and Heinz Moos, and was based at Computer Center GmbH, which later became part of Siemens AG. In May 1975, Inventix developed a user-interface mockup and a "wireframe display" (a wireframe is a network of straight lines or dots connecting the vertices of the drawing elements, to draw a three-dimensional object in 2D). The wireframe was not functional. In September 1975, AutoCAD was complete enough to be demonstrated to Ernst Kellerhals, and other Autodesk and Inventix colleagues. Kellerhals was so impressed by it that he offered to fund the software. Autodesk built a prototype and moved the project to its main office in Somerville, Massachusetts. AutoCAD 1 was released on 15 December 1982. It was designed to be easily operated by a non-professional user. The user interface provided a single menu bar, which contained the menu commands for toolbars, palettes, and special menus. A single dialog box (not modal) was available to display all toolbars, palettes, and special menus, and to change the current commands. The dialog box was draggable and resizable. AutoCAD ran on Microsoft DOS (for the first few years), and its graphical user interface (GUI) could be customized by the user. In addition to being available for Macintosh and IBM PCs, AutoCAD was also available for the first time for workstation/minicomputers, with the development of a new graphics hardware system capable of handling the vector (stereographic) and raster (rasterization) display capabilities of the program. The first version of AutoCAD used a 24-bit color palette, with 8-bit color channels (for red, green, and blue) for 256 possible colors. The first version of AutoCAD was the only commercial CAD software that used a 24-bit color

At the time the program was created, it was one of the first professional program to incorporate 3D views, which was the motivation for its creation. Another reason for AutoCAD development was to compete with the Dassault Systemes and Spatial GIS. AutoCAD was the first CAD program to support working directly on surfaces as 3D objects. The primary reason for making the module is so I can use it in a larger node.js application. If there's no benefit, does this mean the module will live on its own or will it die when the primary application is deleted? A: There are several benefits to creating a module. Your code can be reused by others who may need the same functionality. Since node.js is event driven, you can also create modules that tie into node's event loops, such as: connect http ws If the primary node.js application is deleted, your module will continue to run. This is the case even if the module isn't being re-used by the application. There is one downside to using node's module system. It's tricky to require code in your module that is not a part of your module. For example, suppose you want to use a third-party package in your module. You can't just include that code, because it's not part of your module. To do that, you must write a custom module loader that loads that code into your module. In general, writing a custom module loader is very difficult. I've never written one myself, but I know people who have. In general, it seems like a much easier way to distribute code that isn't your own is by bundling it into a larger project. For example, webpack provides a module bundler, and there are also modules that are meant to bundle up node modules into a larger web app. A: I am always interested to see what a question focuses on, if anything. I'm no expert, but in my humble opinion, modules are quite useful in a larger application. Take the following example: Your application needs the ability to save some specific data to the filesystem Your application is going
